Contents

1.1	Initials	1
1.2	Hello, World!	2
1.3	The 'Click me!' Button	3
1.4	Button with event handling	4
1.5	The Textbox	5
1.6	Checkbox	6
1.7	RadioButton	7
1.8	ListBox	8

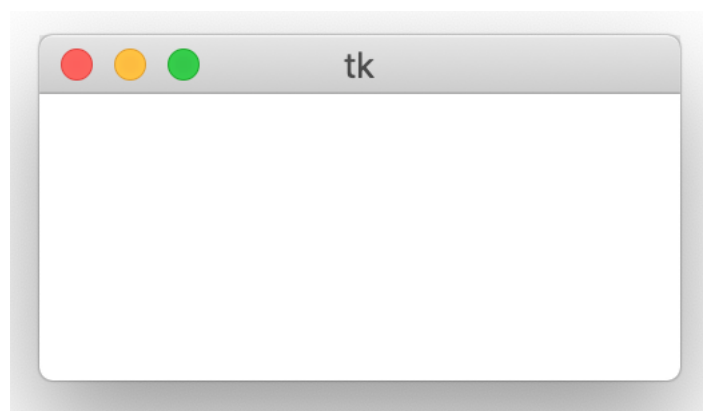

1.1 Initials

Importing the required package, `tkinter`:

```
from tkinter import *
```

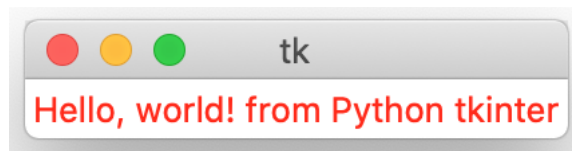

This use of `import` imports the package content and registers the function names into the global namespace.

```
from tkinter import *  
  
root = Tk()  
  
win = Frame(root)  
  
win.pack()  
  
root.mainloop()
```

1.2 Hello, World!

```
from tkinter import *  
  
root = Tk()  
  
win = Frame(root)  
  
lab = Label(win, text = "Hello, world! from Python tkinter", fg="red", bg="white")  
  
lab.grid(column = 1, row = 1)  
  
win.pack()  
  
root.mainloop()
```

1.3 The 'Click me!' Button

```
from tkinter import *

root = Tk()

win = Frame(root)

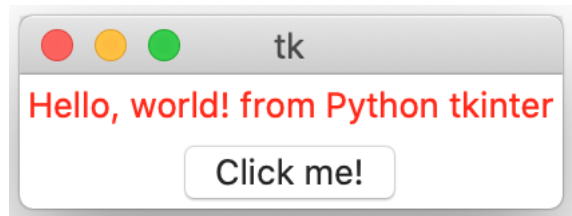

lab = Label(win, text = "Hello, world! from Python tkinter", fg="red", bg="white")

mybutton = Button(win, text = "Click me!")

lab.grid(column = 1, row = 1)
mybutton.grid(column = 1, row = 2)

win.pack()

root.mainloop()
```

1.4 Button with event handling

```
from tkinter import *
from tkinter import messagebox

def handleClick():
    messagebox.showinfo(title = "info", message = "You clicked!")

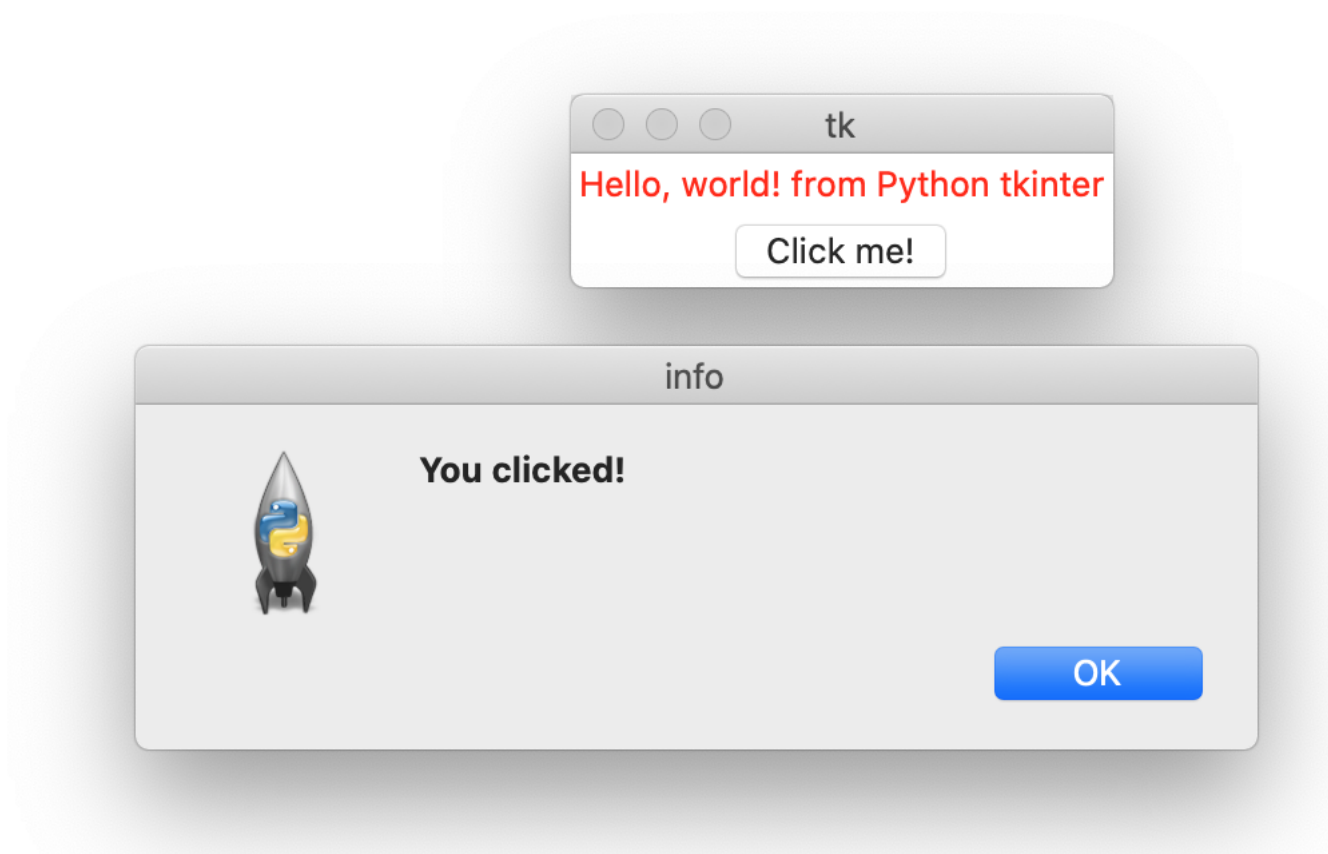

root = Tk()
win = Frame(root)

lab = Label(win, text = "Hello, world! from Python tkinter", fg="red", bg="white")
mybutton = Button(win, text = "Click me!", command = handleClick)

lab.grid(column = 1, row = 1)
mybutton.grid(column = 1, row = 2)

win.pack()

root.mainloop()
```

1.5 The Textbox

```
from tkinter import *
from tkinter import messagebox

def handleClick():
    messagebox.showinfo(title = "info", message = "Hello " + varName.get())

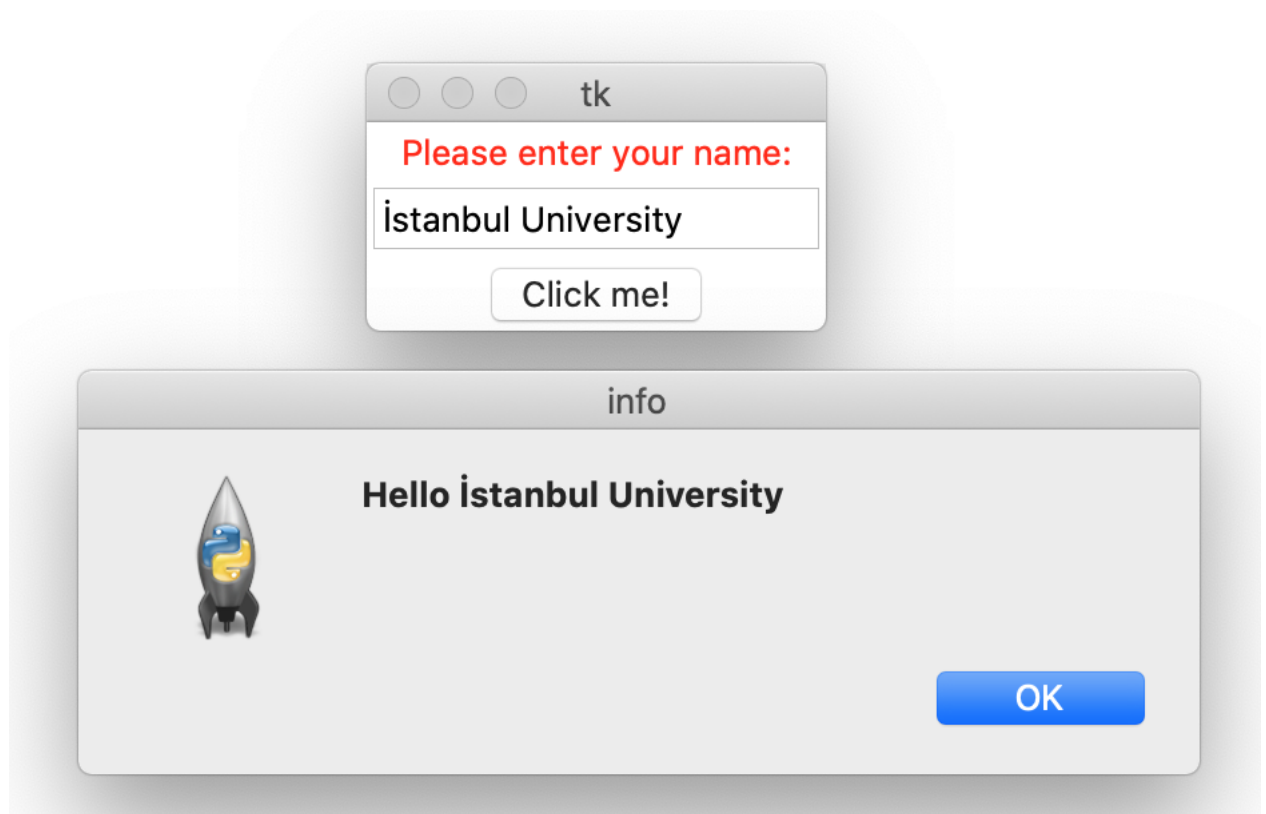

root = Tk()
varName = StringVar()

win = Frame(root)
lab = Label(win, text = "Please enter your name:", fg="red", bg="white")
entrybox = Entry(win, fg="black", bg="white", textvariable = varName)
mybutton = Button(win, text = "Click me!", command = handleClick)

lab.grid(column = 1, row = 1)
entrybox.grid(column = 1, row = 2)
mybutton.grid(column = 1, row = 3)

win.pack()

root.mainloop()
```

1.6 Checkbox

```
from tkinter import *
from tkinter import messagebox

def buttonOnClick():
    strMessage = "The user: "
    if(abilityEng.get() == 1):
        strMessage += "Speaks english"
    if(abilityAnalysis.get() == 1):
        strMessage += "\nCan analysis data"
    messagebox.showinfo(title = "", message = strMessage)

root = Tk()

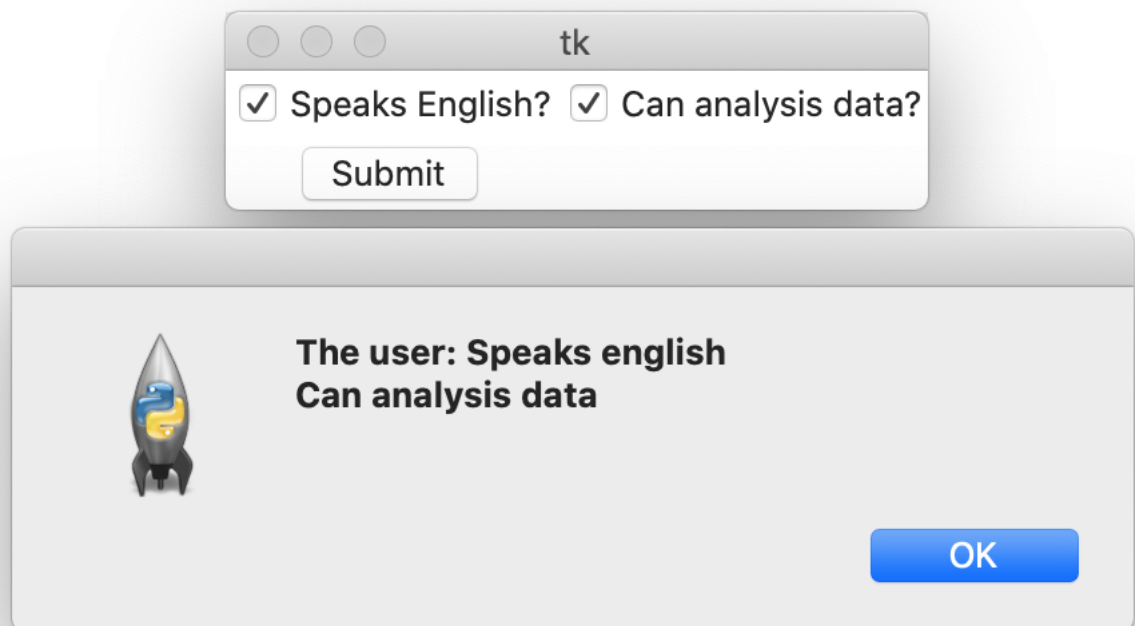

win = Frame(root)

abilityEng = IntVar()
abilityAnalysis = IntVar()

check1 = Checkbutton(master = win, text = "Speaks English?", var = abilityEng)
check2 = Checkbutton(master = win, text = "Can analysis data?", var = abilityAnalysis)
button = Button(master = win, text = "Submit", command = buttonOnClick)

check1.grid(row = 1, column = 1)
check2.grid(row = 1, column = 2)
button.grid(row = 2, columnspan = 2)
win.pack()

root.mainloop()
```

1.7 RadioButton

```
from tkinter import *
from tkinter import messagebox

def handleOption():
    messagebox.showinfo(message = "You select " + language.get())

root = Tk()

win = Frame(root)

language = StringVar()

radio1 = Radiobutton(master = win, text = "R", var = language,
value = "R", command = handleOption)

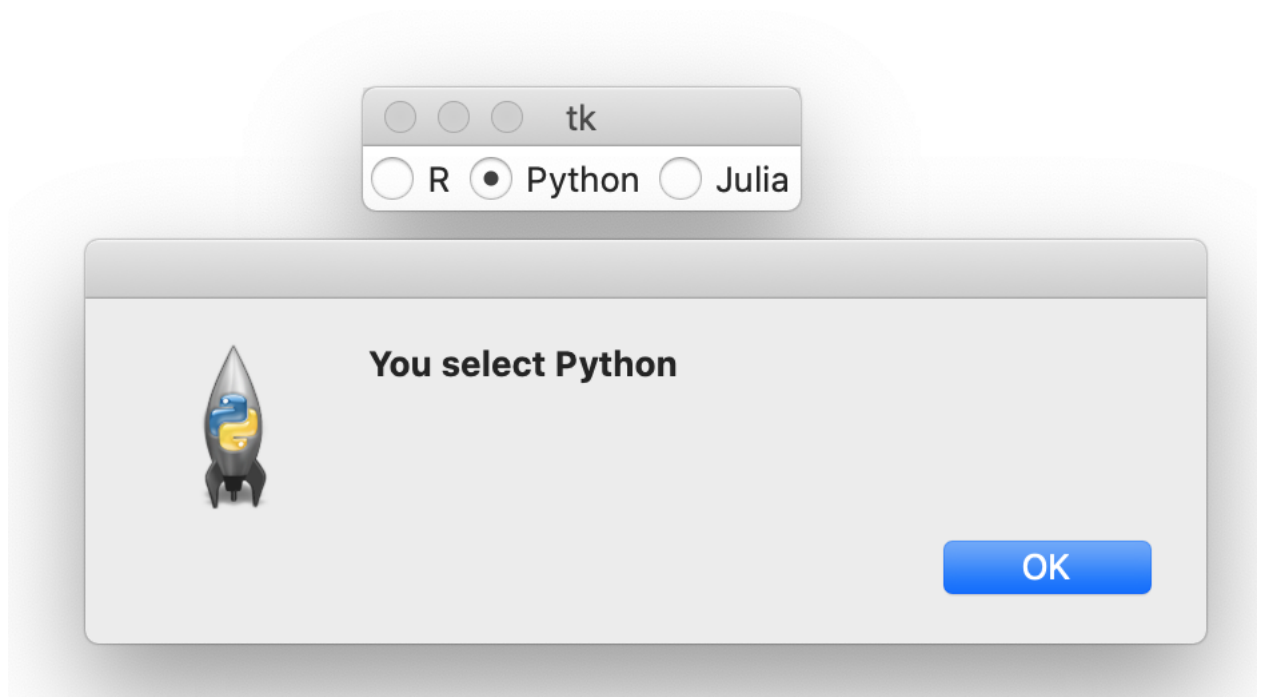

radio2 = Radiobutton(master = win, text = "Python", var = language,
value = "Python", command = handleOption)

radio3 = Radiobutton(master = win, text = "Julia", var = language,
value = "Julia", command = handleOption)

radio1.grid(row = 1, column = 1)
radio2.grid(row = 1, column = 2)
radio3.grid(row = 1, column = 3)

win.pack()

root.mainloop()
```

1.8 ListBox

```
from tkinter import *
from tkinter import messagebox

def handleButton():
    messagebox.showinfo(message = "You select " + mylist.selection_get())

root = Tk()

win = Frame(root)

mylist = Listbox(master = win)
mylist.insert(1, "Econometrics")
mylist.insert(2, "Mathematics")
mylist.insert(3, "Macro Economics")

button = Button(master = win, text = "Select", command = handleButton)

mylist.grid(row = 1, column = 1)
button.grid(row = 2, column = 1)
win.pack()

root.mainloop()
```
